Unexpected Complications in Term Newborns

Unexpected complications among full term newborns with no preexisting conditions.

Sample Calculation (a rate per 1000 livebirths)

Performance Rate = $\frac{\text{Numerator (a = 10 patients)}}{\text{Denominator (b=1000 patients) – Denominator Exclusions (c=10 patients)}}$ * 1000 = 10.1 per thousand livebirths

Stratification 1 = $\frac{\text{Numerator (a1 = 3 patients)}}{\text{Denominator (b=1000 patients) – Denominator Exclusions (c=10 patients)}}$ * 1000 = 3.0 per thousand livebirths

Stratification 2 = $\frac{\text{Numerator (a2 = 7 patients)}}{\text{Denominator (b=1000 patients) – Denominator Exclusions (c=10 patients)}}$ * 1000 = 7.1 per thousand livebirths
